News and Political Knowledge Quiz

What the Public Knows – In Pictures, Maps, Graphs and Symbols

Take the Latest Quiz Online!

Before you read the report, we invite you to test your own News IQ by taking the latest interactive knowledge quiz now available on the Pew Research Center website. The short quiz includes many of the questions that were included in a national poll. Participants will instantly learn how they did on the quiz in comparison with the general public as well as with people like them. To take the latest quiz, click on this link:

News and Political Knowledge Quiz
What the Public Knows – In Pictures, Maps, Graphs and Symbols

The latest update of the Pew Research Center’s regular News IQ quiz uses a set of 13 pictures, maps, graphs and symbols to test knowledge of current affairs. (To take the quiz yourself before reading this report, click here.) At the high end, nearly nine-in-ten Americans (87%) are able to select the Star of David as the symbol of Judaism from a group of pictures of religious symbols. And when shown a picture of Twitter’s corporate logo, 79% correctly associate the logo with that company.

At the low end, just 43% are able to identify a picture of Elizabeth Warren’s from a group of four photographs of female politicians, among them Nancy Pelosi, Tammy Baldwin and Deb Fischer. And when presented with a map of the Middle East in which Syria is highlighted, only half are able to identify the nation correctly.

Overall, majorities correctly answer 11 of 13 questions in the new quiz, which was conducted online January 18-24, 2013, among a random sample of 1,041 adults by the Pew Research Center for the People & the Press.

The quiz includes several items about leading political figures. When shown a picture of New Jersey Gov. Chris Christie, 73% identified Christie from a list that included Newt Gingrich, Scott Walker and Rush Limbaugh. An identical percentage identified John Boehner in a question with a similar format. To see how each question was presented, see the attached survey topline.

*from a set of four photos.  ^from set of four states.
Seven of the 13 items were answered correctly by two-thirds or more of the survey’s respondents. These included identifying the Star of David as the symbol for Judaism (87%), the corporate logo for Twitter (79%), the map of states won in 2012 by President Obama (75%), the photos of Christie and Boehner (73% each), a graph of the unemployment rate (70%) and the symbol for the Euro (69%).

About six-in-ten (62%) could identify the new secretary of state, John Kerry, from a photo lineup of four people. When shown a list of four state maps, and asked which of the states had approved the legalization of same-sex marriage last year, 60% correctly chose the state of Washington. But just 50% were able to identify Syria as country highlighted on a map of the Middle East.

On average, quiz takers correctly answered 8.5 of the 13 questions, a score of 65% correct when graded like a classroom test.

**Identifying Religious Symbols**

The question about religious symbols was modeled on one asked previously in Oct. 2011. In the current survey, four symbols were shown and respondents were asked to identify the one associated with Judaism: 87% correctly selected the Star of David.

In Oct. 2011, respondents were shown the same group of symbols and asked to identify the symbol associated with Islam. Just 42% answered correctly (Crescent and Star, #2 in the graphic.) About a third (34%) incorrectly chose Om, the symbol associated with Hinduism. (For more, see *What the Public Knows – In Words and Pictures*, Nov. 7, 2011.)

PEW RESEARCH CENTER Jan 18-24, 2013. Correct answers are bolded.
In the current quiz, the map identification question about Syria also was modeled on a question in the 2011 survey: 50% correctly identified Syria as the country highlighted on a map of the Middle East from a list of four countries (Turkey, Saudi Arabia and Egypt were the others). In Oct. 2011, Israel was the country highlighted on a map; 57% correctly identified it from a list that had the same alternatives as the current survey.

Young People Fare Well on Many Questions

Younger people typically score lower than older people on tests of political knowledge. That is true for some questions in the current survey, especially those that required an identification of public officials from their pictures. For example, just 46% of those younger than 30 were able to identify John Kerry from his picture as the nominee for secretary of State (the survey was conducted before Kerry was confirmed by the Senate on Jan. 29). Among those 50 and older, 74% chose Kerry’s picture from a group of photos.

Young people also were less likely to identify Christie and...
Boehner from their photos than were those 50 and older.

However, as many people under 30 as 50 and older knew that a map with highlighted states showed those that Obama won in 2012.

And about nine-in-ten young people (91%) could identify Twitter’s corporate logo; only 67% of those 50 and older could do so. Similarly, 79% of the youngest group recognized the symbol for the Euro, compared with 62% among those 50 and older.

**Educational Differences in Knowledge Persist**

The largest group differences in knowledge are found between individuals with lesser and greater levels of education. Respondents with no more than a high school education were less likely than college graduates to answer every question correctly.

Those with a high school education could correctly answer an average of 7.3 questions, compared with 10.1 correct among college graduates. The median gap in percent correct between the low and high education groups is 22 points.

Differences by educational group in the percentage answering correctly ranged from a low of 10 points (identifying the Twitter logo) to 30 points (identifying the flag of China).

**College Grads Much More Knowledgeable Than Others**

PEW RESEARCH CENTER  January 18-24, 2013
Small Partisan Differences in Knowledge

In past versions of the News IQ test, Republicans have often outperformed Democrats and independents, but that was not the case with the current quiz. Overall, Republicans on average answered 8.7 items correctly, no different than Democrats (8.6) and independents (8.7).

Democrats (47%) were more likely than Republicans (37%) to recognize a photo of Elizabeth Warren, the new senator from Massachusetts. Other partisan differences were very small.

About the Survey

The analysis in this report is based on a web survey conducted January 18-24, 2013 among a sample of 1,041 adults, 18 years of age or older. The survey was conducted by GfK Knowledge Networks (KN) among a random sample of households in their nationally representative online research panel, KnowledgePanel. KnowledgePanel members are recruited through probability sampling methods and include both those with internet access and those without. (Those who do not already have it are provided internet access and, if needed, a device to access the internet, when they join the panel.) A combination of random digit dialing (RDD) sampling and address-based sampling (ABS) methodologies have been used to recruit panel members; in 2009 the sampling methodology was switched from RDD to ABS. The panel includes households with landlines and cell phones, as well as those without a telephone. Both the RDD and ABS samples were provided by Marketing Systems Groups (MSG). New panel members are continuously recruited throughout the year, to offset panel attrition as people leave the panel. The survey was conducted in English. Respondents were selected randomly from eligible adult household members of the panel. All sampled members received an initial email on January 18 to notify them of the survey and included a link to the survey questionnaire. One follow-up reminder was sent to those who had not yet respondent on January 20.

The final sample for this survey was weighted using an iterative technique that matches gender, age, education, race, Hispanic origin, and household income to parameters from the September 2012 Census Bureau’s Current Population Survey (CPS). In addition, the sample is weighted to match current patterns of internet access from the October 2011 CPS survey. This weight is multiplied by an initial base or sampling weight that corrects for differences in the probability of selection of various segments of the sample and by a panel weight that adjusts for any biases due to nonresponse and noncoverage at the panel recruitment stage (using all of the parameters mentioned above as well as region, metropolitan area or not, home ownership status and language proficiency among Hispanics). Details about the panel-level weights can be found at [http://www.knowledgenetworks.com/knpanel/KPPanel-Design-Summary.html](http://www.knowledgenetworks.com/knpanel/KPPanel-Design-Summary.html).

Sampling errors and statistical tests of significance take into account the effect of weighting at each of these stages. Sampling error for the total sample of 1,041 respondents is plus or minus 3.8 percentage points at the 95% level of confidence. Sample sizes and sampling errors for other subgroups are available upon request.

In addition to sampling error, one should bear in mind that question wording and practical difficulties in conducting surveys can introduce error or bias into the findings of opinion polls.
About the News IQ Quizzes

News IQ quizzes have been conducted at least twice a year since 2007. The quizzes pose questions to the public about specific policy proposals, concepts, events, places and people in the news. For previous reports see August 2012, April 2012, October 2011, March 2011, November 2010, July 2010, January 2010, October 2009, April 2009, December 2008, February 2008, September 2007 and April 2007. The results from these nationally representative samples of the public are then used to create the quizzes found on PewResearch.org, where visitors can compare their level of knowledge with the public's.

The current News IQ focuses is the second in the series to employ visual questions (the first was in October 2011). Because the questions asked about people's knowledge using pictures, symbols, graphs and maps, a web-based survey was used so people could see and respond to the pictures in the questions. The survey was conducted using GfK Knowledge Networks' KnowledgePanel, an online nationally representative panel of households recruited through probability-based (random) sampling methods. More typically, the News IQ quizzes are administered to a random sample of respondents reached on landlines or cell phones.

The specific questions used in the News IQ quizzes are selected to reflect a range of topical areas and different levels of familiarity to the public. The goal is to include questions that cover facts and concepts that can serve as indicators of the public's awareness of information about important issues in the news.

In addition to the News IQ surveys, the Pew Research Center also regularly includes measures of knowledge in its other survey research. These are typically used to help assess how awareness of and knowledge about issues relates to people's attitudes and opinions on those issues.
